

Latte Art: Running a Model and Plotting

Project Link: <https://www.pyswmm.org>

Date: November 17, 2022

Author: Bryant McDonnell

Version: 1.0

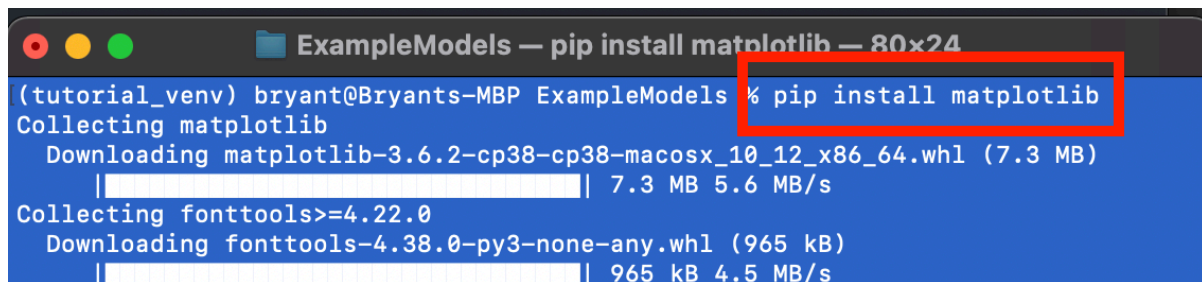

Files: `Latte_art.py`, `Example1.inp`

Background

This example builds on top of the Latte example and shows the user how to create timeseries plots using a library called `Matplotlib`.

For this example you are going to need to install `matplotlib` for you Python instance. When you installed `pyswmm` originally, you opened your command prompt (shell or terminal) and you used `pip` to install. To install `matplotlib` you will need to run the following command. And a quick note, if you are using a virtual environment, you need to activate that first (how to do this is described in a different lesson.)

Run: `pip install matplotlib`

A screenshot of a macOS terminal window titled "ExampleModels — pip install matplotlib — 80x24". The terminal shows the command `(tutorial_venv) bryant@Bryants-MBP ExampleModels % pip install matplotlib` being executed. The output shows the installation progress for `matplotlib` (7.3 MB) and `fonttools` (965 kB). The command prompt and the command itself are highlighted with a red rectangle.

```
(tutorial_venv) bryant@Bryants-MBP ExampleModels % pip install matplotlib
Collecting matplotlib
  Downloading matplotlib-3.6.2-cp38-cp38-macosx_10_12_x86_64.whl (7.3 MB)
    | 7.3 MB 5.6 MB/s
Collecting fonttools>=4.22.0
  Downloading fonttools-4.38.0-py3-none-any.whl (965 kB)
    | 965 kB 4.5 MB/s
```

Code Example

This code builds off of the `Latte` example:

```
'''
PySWMM Latte Art Code
Author: Bryant McDonnell
Version: 1
Date: Nov 17, 2022
'''

import matplotlib.pyplot as plt
import matplotlib.dates as mdates
from pyswmm import Simulation, Nodes, Links, Output
```

```

from swmm.toolkit.shared_enum import SubcatchAttribute, NodeAttribute, LinkAttribute

with Simulation(r'Example1.inp') as sim:
    Node21 = Nodes(sim)["21"]
    Link15 = Links(sim)['15']

    # Initialize Lists for storing data
    time_stamps = []
    node_head = []
    link_flow = []

    sim.step_advance(300)
    # Launch a simulation!
    for ind, step in enumerate(sim):
        time_stamps.append(sim.current_time)
        node_head.append(Node21.head)
        link_flow.append(Link15.flow)

with Output('Example1.out') as out:
    node_head_outfile = out.node_series('21', NodeAttribute.HYDRAULIC_HEAD)
    link_flow_outfile = out.link_series('15', LinkAttribute.FLOW_RATE)

#
https://matplotlib.org/3.1.0/api/\_as\_gen/matplotlib.pyplot.figure.html#matplotlib.pyplot.f
figure
fig = plt.figure(figsize=(8,4), dpi=200) #Inches Width, Height
fig.suptitle("Node 21 Head and Link 15 Flow from simulation and output")
# Plot from the results compiled during simulation time
axis_1 = fig.add_subplot(2,1,1)
axis_1.plot(time_stamps, node_head, '-g', label="Running Sim")
# Plot from the output file
x = node_head_outfile.keys()
y = [node_head_outfile[key] for key in node_head_outfile.keys()]
axis_1.plot(x, y, ':b', label="Output File")
axis_1.set_ylabel("Head (ft)")
#axis_1.get_xticklabels().set_visible(False) # turns off the labels
axis_1.grid("xy")
axis_1.legend()
# Second Axis
axis_2 = fig.add_subplot(2,1,2, sharex=axis_1)
axis_2.plot(time_stamps, link_flow, ls='-', color = 'g')
x = link_flow_outfile.keys()
y = [link_flow_outfile[key] for key in link_flow_outfile.keys()]
axis_2.plot(x, y, ':b', label="Output File")
axis_2.set_ylabel("Flow (CFS)")
axis_2.xaxis.set_major_formatter(mdates.DateFormatter('%m-%d %Hh'))

```

```
axis_2.grid("xy")

fig.autofmt_xdate()
plt.tight_layout()
plt.savefig("TEST.PNG")
plt.show()
```

To run this the you just have to hit `F5` if using `Idle`.

Output

Node 21 Head and Link 15 Flow from simulation and output

Follow up

If you have run into problems, try posting your questions on Stack Overflow and tag it with `pyswmm`. The development team is very active on there and will for sure follow up!
